

WAXING AFTER CARE

Waxing after care is an important element of a waxing treatment. Your therapist has taken the time to protect you from infection, and in addition to normal hygiene routines, a soothing antiseptic preparation such as our **Monu After Cairfree Oil** has been applied.

For you to maintain that silky smooth feeling, it is important to remember to take care of the waxed area, especially within the first 24 hours. When a large number of hairs have been removed this area can easily pick up an infection.

After care recommendations.

Avoid sunbathing, sunbed treatments, and very hot baths for 48 hours as the waxed areas will be extra sensitive to heat. Avoid friction from nylon material or tight clothing.

How long will the results last?

We recommend that you schedule regular waxing treatments to ensure that the results are permanent. How often this should be will vary between individuals. Your therapist will be able to advise you on your requirements.

Is there a follow-up home care routine?

Avoid using perfumed body lotions or creams. We recommend **Monu Depil Lotion** which is a light, easily absorbed lotion, formulated to calm, soothe and hydrate the skin after waxing. Providing 24-hour hydration - the skin feels soft and smooth for longer. Incorporating an active concentrate which gradually weakens hair follicles without irritation, helping to reduce in-growing hairs. Hair re-growth appears finer and depilation's less painful. Always wash your hands before applying any lotion. If you experience redness or discomfort consult your doctor.
