

ELECTROLYSIS

Unwanted hair is a common problem affecting most women to varying degrees throughout their lives and prompting the use of various temporary methods of hair reduction or hair management systems. However, electrolysis is still the only proven permanent method of hair removal and many women have benefitted from this tried and trusted treatment.

Electrolysis, a modern increasingly popular treatment, is now even more gentle, effective and comfortable.

What is Electrolysis?

Electrolysis is a safe, effective, progressive and permanent method of removing unwanted hair. Indeed, it is the only truly permanent method of hair removal.

With the choice of three methods currently available; Galvanic, Diathermy and now Blend, there is a method to suit everyone. Your treatment can therefore be “tailor-made” to suit you.

How does Electrolysis work?

A fine probe (about the size of an eyelash) is inserted into the hair follicle where a tiny burst of energy is targeted at the root of the hair. This action prevents nutrients feeding the hair and the hair becomes weaker and finer. After repeated treatments, the hair is no longer able to grow and complete hair free results are obtained.

Each hair requires repeated treatment because each individual hair has its own growing cycle and blood supply.

Electrolysis works by weakening the hair and eventually destroying it.

Results take a little time, but if a treatment plan is followed and regular treatments are taken, then results are positive.

Is Electrolysis Safe?

Electrolysis was first invented in 1875 and has proven both effective and totally safe.

Advancing technology has meant electrolysis has become more gentle and comfortable

What will happen during the first appointment?

You will have a thorough consultation to ensure treatment is suitable and which method is best for you. You will have a chance to ask questions about the treatment and to experience a “taster” session and your therapist will discuss a “treatment plan” with you.

What about hygiene?

Sterex disposable probes are used to totally eliminate any risk of cross infection. For each client, a brand new sterile probe is used and you will see the individually packed sterile probe opened in front of you

Electrolysis is a safe, effective, comfortable treatment for every client with varying hair growths
